

Anomaly Detection

Question: Knowing that the image has 512x512 pixels, what is the type of anomaly shown at coordinates (500,293)?

Options: A: cloud_shadow B: double_plant C: planter_skip D: standing_water E: waterway F: weed_cluster G: No anomaly

Answer: G

Reasoning:

1. The question specifies that the image has dimensions of 512x512 pixels, and we are tasked with identifying the anomaly at coordinates (500,293). This means we need to focus on the bottom-right section of the image.
2. The options provided include various types of anomalies such as cloud_shadow, double_plant, planter_skip, standing_water, waterway, weed_cluster, and no anomaly.
3. Observing the image, the area at coordinates (500,293) shows a uniform texture consistent with the surrounding cultivated field, with no distinct bright green patches or irregularities.
4. The other options can be ruled out: - "cloud_shadow" would appear as a dark shadow, which is not present. - "double_plant" refers to overlapping rows of crops, which is not visible here. - "planter_skip" would show gaps in planting, which is not evident. - "standing_water" would appear as reflective or water-like areas, which are absent. - "waterway" would indicate a stream or channel, which is not visible. - "weed_cluster" is incorrect because there are no bright green patches at (500,293). - "No anomaly" is correct because the area is uniform with no irregularities.
5. Based on the analysis, there is no anomaly at (500,293). Final Answer: G

GPT-4.1:  [bert_f1: 0.33] [rouge1_f: 0.32]

1. The question asks for the type of anomaly at coordinates (500,293) in a 512x512 pixel image, which is near the right edge of the image.
2. The right side of the image shows a dense, irregular patch of bright green vegetation, contrasting with the more uniform, sparse area on the left.
3. Among the options, "weed_cluster" best describes a dense, irregular patch of vegetation, as opposed to the other options which refer to water, planting errors, or the absence of anomalies.
4. Therefore, the anomaly at the specified coordinates is most consistent with a weed cluster. Answer: F

InternVL3-38B:  [bert_f1: 0.19][rouge1_f: 0.22]

1. The image shows a field with a noticeable cluster of green vegetation in the lower right corner.
2. The coordinates (500,293) fall within this cluster of green vegetation.
3. Given the options, the anomaly that matches a cluster of vegetation in an otherwise sparse field is "weed_cluster."
4. Therefore, the correct answer is F: weed_cluster. Answer: F
